

PATENT APPLICATION OF
GARRY TSAUR
FOR
MULTIPLE APPLICATORS

BACKGROUND-FIELD OF INVENTION

The present invention relates generally to a sealed container. More specifically the present invention relates to a sealed container of multiple applicators that may be removed and used one at a time.

BACKGROUND-DESCRIPTION OF RELATED ART

Applicators such as cotton swabs are generally used to apply medication, anesthetic, alcohol, and various other liquids and viscous substances such as creams. Swab applicator generally comprises of a tubular handle with a formed absorbent tip at one or both ends of the tubular handle. The absorbent tip may be made of cotton or a foam absorbent material. The tip

may also be a brush. The tubular handle may be made of wood, paper, or plastic and it may be solid or hollow.

Generally the applicator tip of a dry swab applicator is first placed in contact with the liquid to be applied for the applicator tip to absorb the liquid. Subsequently, the moisturized applicator tip is placed in contact with the surface to apply the absorbed liquid to the surface. Swab applicators may also be pre-moistened with the desired liquid or viscous substance such as a cream and sealed in a container for subsequent use. Generally the pre-moistened swab applicators are packaged individually so that opening the packaging to retrieve one swab applicator will not affect the remaining swab applicators.

SUMMARY OF THE INVENTION

The present invention is a sealed container of multiple applicators that may be selectively opened and removed one at a time. The multiple applicators comprises of an elongated housing that is separated into multiple sealed compartments containing a liquid or a viscous substance with a score line formed at each of the sealed compartments wherein the elongated housing may be selectively severed into shorter sections at the score lines and removed. In the preferred embodiment, each of said sealed compartments also encloses an applicator tip such as a swab applicator affixed within the sealed compartment with the applicator tip disposed near the score line. The removed section of the elongated housing is used to apply the liquid or viscous substance contained therein and disposed of after application. The remainder of the elongated housing with the remaining unused applicator tips and liquid or viscous substance is retained for other applications or for subsequent uses.

BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 shows the preferred embodiment of the multiple applicators.

Figure 2 shows another embodiment of the multiple applicators.

Figure 3 shows another embodiment of the multiple applicators.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Figure 1 shows the preferred embodiment of the present invention. In the preferred embodiment, the multiple applicators comprises of an elongated housing 1 that is separated into multiple sealed compartments 2 along its length. Each of the sealed compartments 2 may be either dry or contains a liquid or a viscous substance. A score line 3 is formed at each of the sealed compartments 2 wherein each sealed compartment 2 may be snapped open and removed at the score line 3. The elongated housing 1 may be selectively severed into shorter sections at the score lines 3 and removed. In the preferred embodiment, one end 4 of the elongated housing 1 may be extended beyond the sealed end of the last sealed compartment to act as a handle for the user to hold such that the last sealed compartment may be snapped open at the score line easily. After the sealed compartment is snapped open and used, it may be disposed of while the remainder of the elongated housing with the remaining unused sealed compartments and any liquid or viscous substance within them are retained for other applications or for subsequent uses.

The elongated housing 1 may be of any desire length with multiple sealed compartments 2 of any desired length along its length. The elongated housing 1 may also be straight or curved. When the elongated housing 1 is curved, it may be formed into a spiral and allows easy and compact storage and transportation.

Figure 2 shows another embodiment of the present invention. In this embodiment the multiple applicators comprises of an elongated housing 5 that is separated into multiple sealed compartments 6 along its length. One or more of the sealed compartments encloses an elongated member 7 with one end affixed to one end of the sealed compartment 6 and contains a liquid 8. A score line 9 is formed at each of the sealed compartments 6 near the free end of the elongated member 7 wherein the sealed compartment 6 may be snapped open and removed at the score line 9.

When the diameter of the elongated housing 5 is reduced to a dimension such that the liquid 8 will not reliably flow out of the compartment 6 due to its surface tension, the elongated member 7 will increase the capillary action and disrupt the surface tension of the liquid 8 contained within the sealed compartment 6 and allow the liquid 8 to reliably flow out of the sealed compartment 6 once it is snapped opened. The elongated housing 5 may be selectively severed into shorter sections at the score lines 9 and removed. One end 10 of the elongated housing 5 may be extended beyond the sealed end of the last sealed compartment to act as a handle for the user to hold such that the last sealed compartment may be snapped open at the score line easily. After the sealed compartment 6 is snapped open and used, it may be disposed of while the remainder of the elongated housing with the remaining unused sealed compartments and any liquid or viscous substance within them are retained for other applications or for subsequent uses.

Figure 3 shows yet another embodiment of the present invention. In this embodiment the multiple applicators comprises of an elongated housing 11 that is separated into multiple sealed compartments 12 along its length. One or more of the sealed compartments 12 encloses a liquid 13 or a viscous substance and an elongated member 14 with one end affixed to one end of the

sealed compartment 12 and an applicator tip 15 affixed to its free end. A score line 16 is formed at each of the sealed compartments 12 near the applicator tip 15 wherein the sealed compartment 12 may be snapped open and removed at the score line 16. After removal, the applicator may be used to apply the liquid 13 or viscous substance within it.

When the diameter of the elongated housing 11 is reduced to a dimension such that the liquid 13 will not reliably flow out of the compartment due to its surface tension, the elongated member 14 will increase the capillary action and disrupt the surface tension of the liquid 13 contained within the sealed compartment 12 and allow the liquid 13 to reliably flow out of the sealed compartment 12 and into the applicator tip 15 once it is snapped open. The elongated housing 11 may be selectively severed into shorter sections at the score lines 16 and removed. One end 17 of the elongated housing 11 may be extended beyond the sealed end of the last sealed compartment to act as a handle for the user to hold such that the last sealed compartment may be snapped open at the score line easily. After the sealed compartment is snapped open and used, it may be disposed of while the remainder of the elongated housing with the remaining unused sealed compartments and any liquid or viscous substance within them are retained for other applications or for subsequent uses.

Various combinations of the above disclosed multiple applicators are possible. For example, elongated housing may contain multiple sealed compartments with various combinations of dry, wet, elongated member, or applicator tips. The sealed compartments may all have the same content or may have various combinations of contents within them.

Furthermore, an optional holder may be used to hold the removed applicator section if a longer length is desired. The holder may be a hollow tube or a solid tube with one or more holes at its end that will slide over the removed applicator section and retain it in the hollow end or one

of the holes for application. The holder may also be a hollow end of the elongated housing that extends beyond the sealed end of the last sealed compartment. After application, the removed applicator may be detached from the holder and disposed. The holder may be re-used to hold the next applicator section.

Although the description above contains many specificities, these should not be construed as limiting the scope of the invention but as merely providing illustrations of some of the presently preferred embodiments of this invention. Thus the scope of the invention should be determined by the appended claims and their legal equivalents, rather than by the examples given.
